# Economic Analysis and Optimal Sizing for Behind-the-meter Battery Storage

**DI WU** 

Pacific Northwest National Laboratory Interagency Sustainability Working Group Webinar March 22, 2018

### Grid Applications/Services using Energy Storage

- Transmission level
  - energy arbitrage
  - frequency regulation
  - spin and non-spin reserve
  - primary frequency response
  - resource adequacy
- Distribution level
  - distribution upgrade deferral
  - outage mitigation
  - volt/var support
- Behind-the-meter and customer domain
  - energy charge reduction (load shaping charge or energy imbalance charge)
  - demand charge reduction

#### **Battery Storage for Behind-the-meter Applications**

Energy charge is based on the amount and time when energy is consumed.

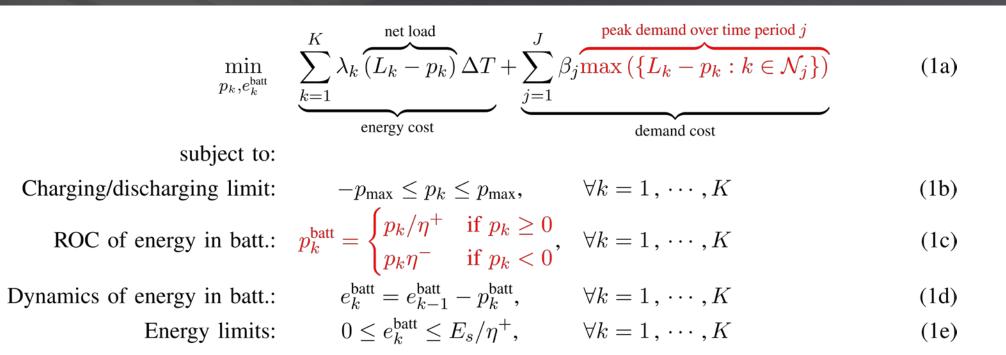

- Load shaping charge and energy imbalance charge are very similar as energy charge and can be modeled using the same mathematic formulation.
- Demand charge is based on the highest power consumption in different time periods.
- Separate charges for energy and demand more fairly distributed power system's operation and investment cost to customers.
- Example of electric utility rate tariff

		Summer	Winter (OctMay)
	On	0.145	NA
Energy (\$/kWh)	Mid	0.092	0.096
	Off	0.067	0.073
Demand (\$/kW/month)		30	

5

### **Battery Optimal Dispatch**

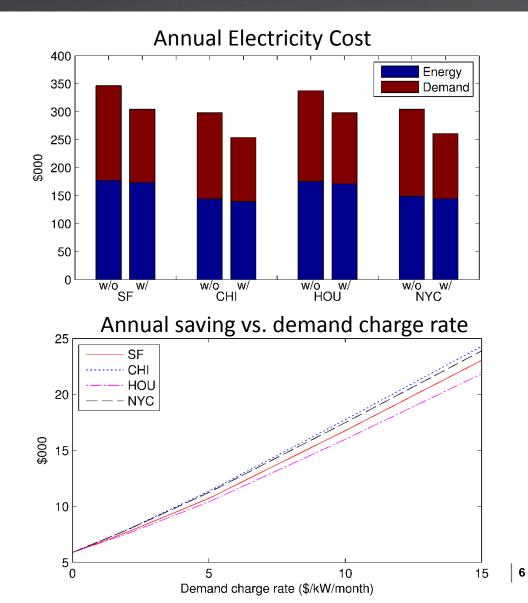

- $L_k$ : Load without battery at time step k (e.g., 15-minute or hour).
- $p_k$ : Battery charging/discharging power (measured at AC side) at time step k, which is positive when discharging, i.e., using generator convention.
- D. Wu, C. Jin, P. Balducci, and M. Kintner-Meyer, "An energy storage assessment: Using optimal control strategies to capture multiple services," *IEEE Power and Energy General Meeting*, Denver, CO, Jul. 2015.

### **Annual Electricity Cost and Saving**

Battery rating: 0.2 MW/0.8 MWh Efficiency: 0.868 (charging) and 0.887 (discharging)

- Demand charge account for half of total electricity bill. The capability of lowering peak from battery provides a great opportunity to cut electricity bill.
- Saving in energy charge is marginal comparing with demand charge due to losses.
- Total saving in electricity bill do not vary significantly with office load patterns.
- Energy charge reduction is independent of load profiles.
- Annual saving in electricity bill is quite linear to demand charge rate.

### **Optimal Sizing**

Sensitivity of net value on battery sizes with Chicago office building load profile

## Annual benefits vs. levelized cost with optimal size

### Los Alamitos Microgrid with Energy Storage

- Background
- Key questions
  - What are the potential benefits from different investment candidates?
  - What is the optimal scale in terms of power and energy capacity for the energy storage systems?
  - How can we evaluate tradeoffs between benefits accruing to end-user and utility?

#### Use cases

Utility benefits

#### Capacity value

- Energy time shifting
- Regulation services
- Spin and non-spinning reserves
- Outage mitigation
- Distribution investment deferral
- Voltage support

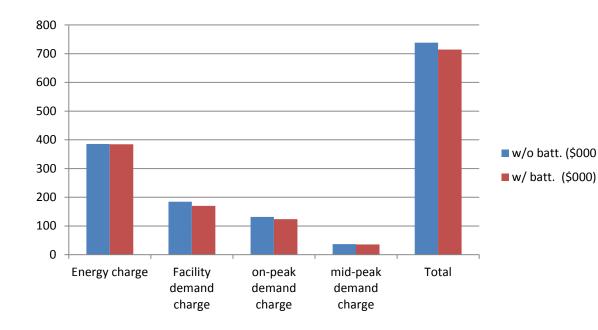

#### End-user benefits

- Energy time shifting (reduce energy charge)
- Peak demand reduction (reduce demand charge)
- Outage mitigation

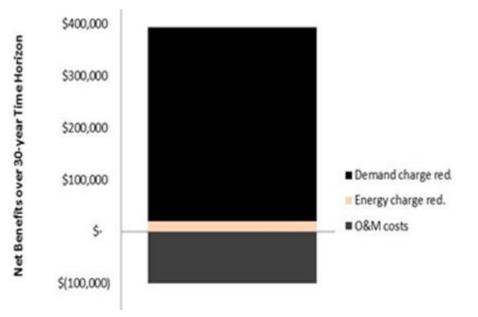

#### **Results in Scenario a**

175 kW/175 kWh (behind-the-meter, benefits to end-user)

#### Annual

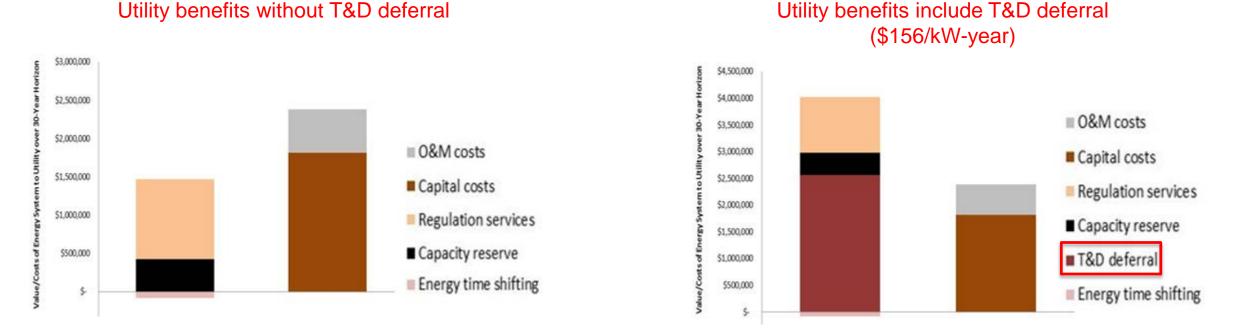

Key Point: BSET found optimal energy storage sizing at 204 kW/258 kWh when combined with 625 kW of PV.

#### **Present value**

#### **Results in Scenario b**

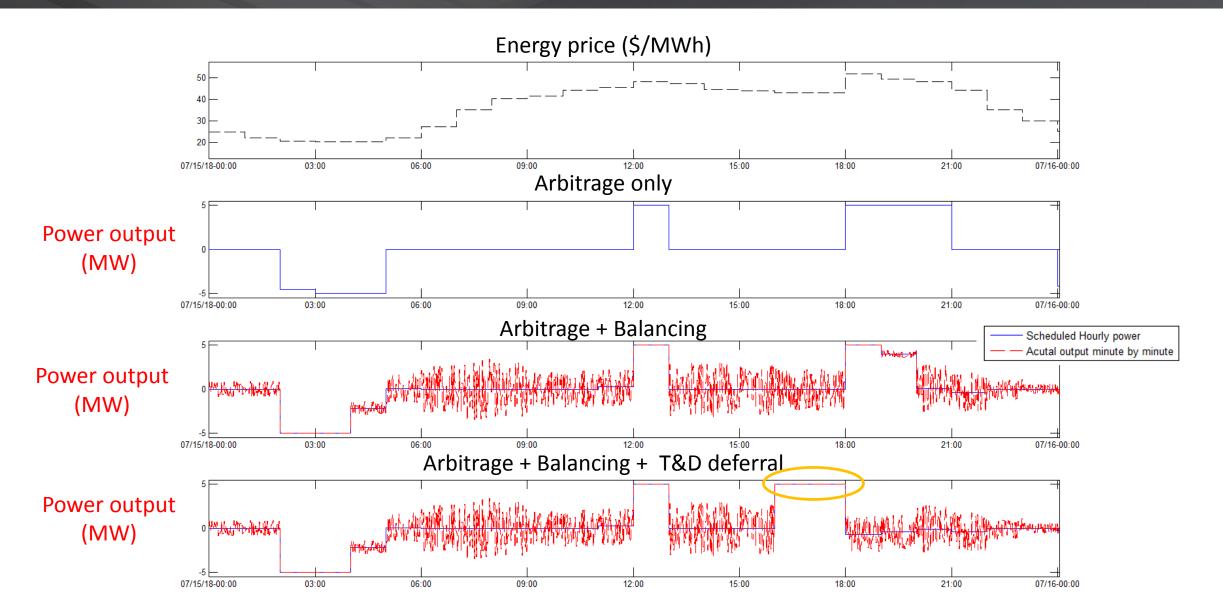

1 MW/1 MWh (utility invested and owned)

Key Point: In base case, energy storage benefits are significant but fall short of costs. Adding transmission and distribution (T&D) system upgrade deferral could easily yield benefits that exceed costs.

#### **Bundling Services: How To Do It Optimally?**

### **Pareto Front for Multi-objective Optimization**

#### 175kW /175kWh battery

Annual 25 \$4,000,000 0 \$3,500,000 20 0 Net benefits to end-user (\$000) 8 \$3,000,000 15  $\cap$ Net benefits to end-user 0 \$2,500,000 0 0 \$2,000,000 10 0 0 0 \$1,500,000 5 0 Not good \$1,000,000 solutions 0 \$500,000 \$--5 Ś-\$200,000 \$400.000 \$600.000 \$800.000 \$1,000,000 \$1,200,000 12 0 2 8 10 14 16 6 Utility benefits excluding reduciton in end-user payment Utility benefits (\$000) excluding reduciton in end-user payment

Present value

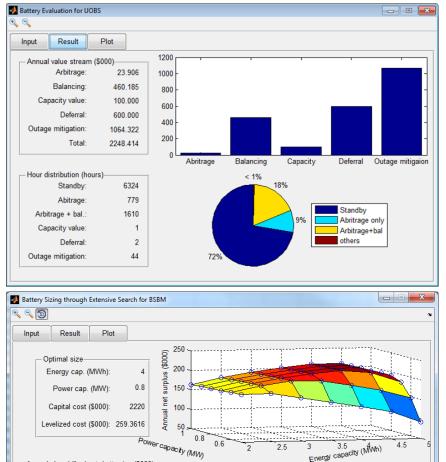

625 kW PV + 175kW /175kWh battery

There does not exist a single solution that can simultaneously maximize both objectives; there exist Pareto optimal solutions
